CQI approaches can strengthen health promotion in your service by improving quality and supporting systems development for health promotion practice. The One21seventy health promotion CQI tools were developed using the best available research evidence and have been tested in Aboriginal and Torres Strait Islander settings to ensure they are practical and user friendly. The health promotion CQI tools enable services to:

- systematically describe and assess how well activities align with good practice
- assess how well organisational systems are functioning
- plan how to improve systems that support good practice.

CQI processes bring staff together to focus on health promotion. Other benefits include capacity to benchmark your service’s health promotion and to contribute to the growing evidence base of effective health promotion activities in Indigenous communities in Australian and international contexts.

Health promotion systems assessment tool

The systems assessment tool is structured around four system components that influence the delivery and quality of health promotion (Figure 2).

A Facilitator’s Guide supports team discussion and scoring.

Health promotion audit tool

The audit tool is structured around five key elements of good health promotion practice: planning, targeting, community participation, partners and evaluating. The elements come together to form a planning cycle, with community participation central to successful practice (Figure 1).

A protocol guides the completion of the audit.

Health promotion systems assessment tool

The systems assessment tool is structured around four system components that influence the delivery and quality of health promotion (Figure 2).

Supporting resources and services

- Training in use of the tools
- A Helpdesk service and toll free phone number
- Report interpretation guide
- Templates and facilitation for CQI goal setting and action planning
- Recommended resources for health promotion planning, implementation and evaluation
