

Are you **itchy**, especially at night?

Do you have a **rash** between your fingers, on your wrists, elbows, knees, ankles or bottom?

These are typical signs of scabies, which is caused by a tiny mite that lives in the skin. If you're worried you might have scabies, researchers in Darwin are investigating a new potential treatment for scabies in a clinical trial.

If you're aged 18 years and over, you may like to think about participating in this trial. If you qualify for the study, you may be compensated for your time.
