# CAUSES OF ANTIBIOTIC RESISTANCE

Antibiotic resistance happens when bacteria change and become resistant to the antibiotics used to treat the infections they cause.

Over-prescribing of antibiotics

Patients not finishing their treatment

Over-use of antibiotics in livestock and fish farming

Poor infection control in hospitals and clinics

Lack of hygiene and poor sanitation

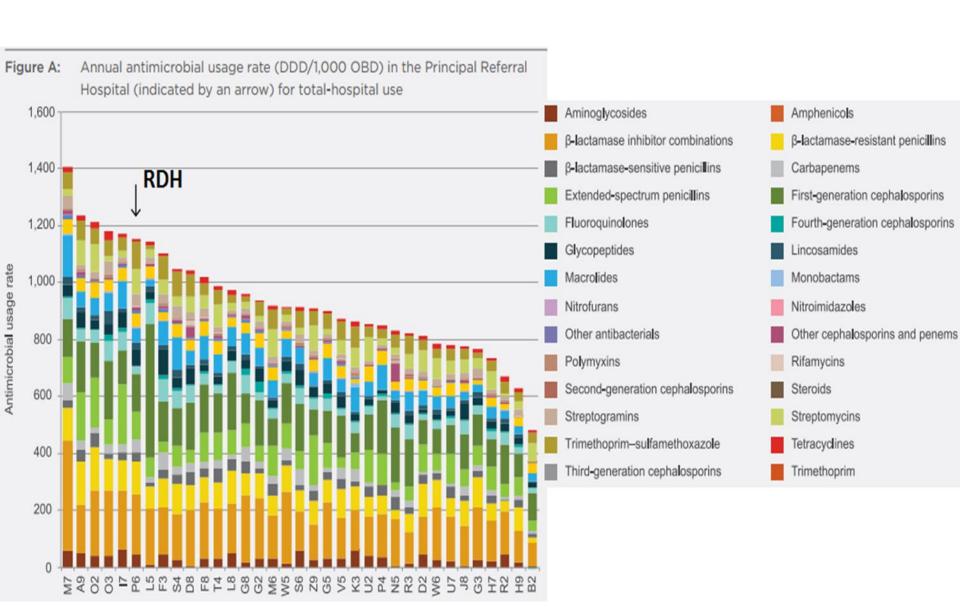

Lack of new antibiotics being developed

www.who.int/drugresistance

# Community-acquired methicillin-resistant Staphylococcus aureus in Central Australia

Claire L Stevens, Anna Ralph, James ET McLeod, Malcolm I McDonald

## **Abstract**

To date, there has been scant information about the burden of methicillin-resistant Staphylococcus aureus infections in Central Australia. Our aims were to determine the proportion of Staphylococcus aureus infections due to methicillin-resistant strains in Central Australia, to characterise resistance to non-beta lactam antibiotics and to correlate findings with available demographic information. We retrospectively reviewed S. aureus isolates identified by the Microbiology Laboratory of the Pathology Department, Alice Springs Hospital between September 2005 and February 2006. Multi-resistance was defined as resistance to three or more non-beta lactam antibiotics. We identified the recovery site and extended antibiotic resistance profile of each isolate. Demographic data included place of residence, discharge diagnosis and ethnicity. There were 524 S. aureus isolates: 417 (79.6%) methicillin-sensitive S. aureus, 104 (19.7%) non-multi-resistant MRSA (nmrMRSA) and 3 (0.7%) multi-resistant MRSA (mrMRSA). MRSA accounted for 7/22 (32%) invasive infections and 91/474 (19.2%) cases of staphylococcal skin infections. Aboriginal people comprised 89 per cent (93/104) of patients with nmrMRSA; 57 per cent lived in remote communities, 21 per cent in suburban Alice Springs, and 18 per cent in Alice Springs Town Camps. Six per cent (6/104) of nmrMRSA were hospital-acquired. Of the nmrMRSA isolates, 57 per cent (59/104) were resistant to erythromycin and 7 per cent (7/104) to fusidic acid. All MRSA isolates were susceptible to co-trimoxazole. In conclusion, Central Australia has high rates of community-acquired nmrMRSA and low rates of multi-resistant MRSA. Erythromycin resistance in S. aureus is also common. These findings should prompt the review of antimicrobial prescribing guidelines for the region, especially for treatment of skin and soft tissue infections. Commun Dis Intell 2006;30:462-466.

# Antimicrobial stewardship TEHS

# Staffing and structure

- One full time AMS pharmacist
- FTE 0.1 Infectious Diseases Physician
- AMS Committee with RDH, KDH, GDH representation
- Restricted antimicrobials system
- Strong culture of Infectious Diseases consultation
- New electronic prescribing support

# AMS rounds, RDH

- Daily ward list produced from electronic prescribing and pathology databases to identify:
  - Any prescription of a restricted antimicrobial
  - Drug-bug mismatch
  - Creatinine-dose mismatch
  - Wrong dose
  - Drug interaction
  - Illogical combination of antibiotics
  - IV antibiotic order continued for >3 days

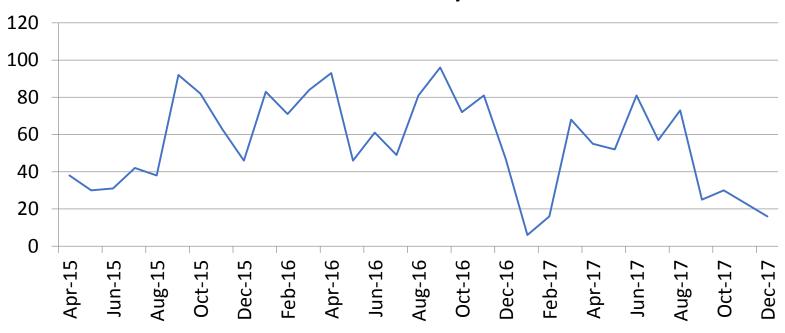

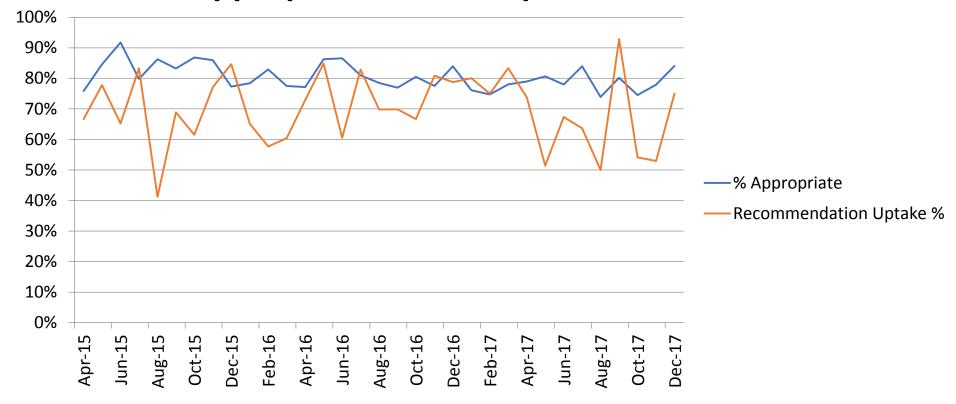

## Number of recommendations made by month

## **% Appropriate and % Uptake**

- √ 80% appropriate prescribing
- √ 69% of AMS team recommendations followed

Medical Recommendation Type Summary

			Percentage
			Changed Following
Type of Error	Number	Percentage of	Recommendation
IV antibiotic treatment continuing long term for non-severe		0.050/	70.70
infection	28	0.26%	72.7%
Overly broad antimicrobial used	19	0.18%	73.7%
Duplication of therapy	18	0.17%	100.0%
Dosage incorrect	12	0.11%	33.3%
Over/underdosage in respect to poor renal/hepatic function	12	0.11%	100.0%
Ceftriaxone used first line for pyelonephritis	11	0.10%	18.2%
Penicillin/cephalosporin not used despite minor reaction or			
no allergy present to other class	7	0.07%	50.0%
Drug - bug mismatch	7	0.07%	80.0%
TOTAL	114		68.6%

Please email any recommendations for improvement (big or small) to john.shanks@nt.gov.

Filter Items Q **Antibiogram TEHS** Ascending cholangitis Bites (animal and human) Carbuncle/Abscess Cellulitis Cellulitis of the eye Diabetic foot infection Dosing nomograms and calculators **Epiglottitis** Febrile neutropenia Influenza infection

## Cellulitis

Is there a purulent focus for infection such as an abscess or carbuncle?

Yes	
No	

## **Cellulitis**

Does the patient have a penicillin allergy? (See below for details on penicillin allergy severity)

No penicillin allergy

Minor penicillin allergy

Anaphylaxis/life-threatening reaction

### History of penicillin allergy or adverse reaction

#### No penicillin allergy

- . This includes non-severe reactions such as nausea and limited diarrhoea
- . Such reactions are frequently not replicable or generalizable to the whole class. It is safe to prescribe penicillin class antibiotics (with the patient's knowledge), and if rec

#### Minor penicillin allergy

- . This includes non-severe reactions such as isolated rash.
- There is only a 2-3% chance of cephalosporin allergy in a patient with a previous IgE mediated allergy to penicillin, and probably even less for other types of allergies. Ir to penicillin

#### Anaphylaxis/life-threatening reaction

• This includes anaphylaxis (see below) and other life-threatening reactions such as Stevens-Johnson Syndrome (SJS), Toxic epidermal necrolysis (TEN), Drug reaction

#### Minor penicillin allergy

## Severe cellulitis treatment

For empirical therapy in a patient with no penicillin allergy, while awaiting the results of cultures and susceptibility use:

Flucloxacillin 2 g (child: 50 mg/kg up to 2 g) IV, 6-hourly

Switch to oral therapy when systemic features have improved (see switch to oral guideline on the PGC for details)

- o In addition to treating cellulitis examine patient for tinea of the feet and treat if necessary
- This is a guide for empirical treatment only. It is imperative that cultures are taken prior to administration of antibiotics (where possible) for targeted therapy
- For patients with significant systemic symptoms, assess for necrotising fasciitis or underlying myonecrosis, see the Therapeutic Guidelines section on necrotising skir
- For patients with associated bacteraemia see the severe sepsis section or the severe sepsis: directed therapy section of the Therapeutic Guidelines
- Vancomycin may also be needed in patients with severe sepsis or septic shock. (see the severe cellulitis treatment in a patient with severe penicillin allergy for the do

# **Key points**

- Rationale use of antibiotics requires intensive, ongoing education and oversight at prescriber and user levels
- Antibiotic consumption is necessarily high in the NT with scope for improvement
- Knowing the local antibiogram important for informing local guidelines
